

**II Year-II Semester  
(20CE4763) Solid Mechanics**

Int. Marks	Ext. Marks	Total Marks	L	T	P	C
30	70	100	3	-	-	3

**Pre- Requisites: Fundamentals of Engineering Mechanics**

**Course Objectives:**

- To impart preliminary concepts of Strength of Material and Principles of Elasticity and Plasticity Stress strain behaviour of materials and their governing laws. Introduce student the moduli of Elasticity and their relations
- To give concepts of stresses developed in the cross section and bending equations calculation of section modulus of sections with different cross sections
- To give concepts of Principal stresses and strains developed in cross section of the beams on the cross section and stresses on any inclined plane. To impart concepts of failures in the material considering different theories
- To give concepts of torsion and governing torsion equation, and there by calculate the power transmitted by shafts and springs and design the cross section when subjected to loading using different theories of failures.
- To classify columns and calculation of load carrying capacity and to assess stresses due to axial and lateral loads for different edge conditions
- To classify cylinders based on their thickness and to derive equations for measurement of stresses across the cross section when subjected to external pressure.

**UNIT-I: Simple Stresses & Strains and Strain Energy:**

Elasticity And Plasticity - Types Of Stresses And Strains - Hooke's Law, Stress Strain Diagram For Mild Steel, Working Stress, Factor Of Safety, Lateral Strain, Poisson's Ratio & Volumetric Strain - Elastic Moduli & Relationship Between Them - Bars Of Varying Section - Temperature Stresses, Strain Energy - Gradual, Sudden, Impact And Shock Loadings.

**UNIT-II: Flexural stresses & Shear Stresses:**

Theory Of Simple Bending Assumptions, Derivation of Bending Equation  $M/I = F/Y = E/R$ , Neutral Axis, Determination of Bending Stresses - Section Modulus of Rectangular and Circular Sections, I, T, Angle & Channel Sections Design of Simple Beams

**Shear Stresses:** Derivation Of Formula - Shear Stress Distribution Across Various Beam Sections Like Rectangular, Circular, Triangular, I,T Angle Sections

**UNIT-III: Principal Stresses & Strains and Theories of Failures:**

Introduction – Normal & tangential Stresses on an inclined plane for Bi-axial stresses - two perpendicular normal stresses accompanied by a state of simple shear - Mohr's circle of stresses – graphical solutions.

**Theories Of Failures:** Introduction – Various Theories of failures like Maximum Principal stress theory – Maximum Principal strain theory – Maximum shear stress theory – Maximum strain energy theory – Maximum shear strain energy theory.

**UNIT –IV: Torsion of Circular Shafts and Springs:**

Theory of pure torsion – Derivation of Torsion equations:  $T/J = q/r = N\phi/L$  – Assumptions made in the theory of pure torsion – Torsional moment of resistance – Polar section modulus – Power transmitted by shafts – Combined bending and torsion and end thrust.

**Springs:** Introduction – Types of springs – deflection of close and open coiled helical springs under axial pull and axial couple – springs in series and parallel – Carriage or leaf springs.

#### **UNIT-V: Columns and Struts:**

Introduction – Types of columns – Axially loaded compression members – Crushing load – Euler's theorem for long columns- assumptions- derivation of Euler's critical load formulae for various end conditions – Equivalent length of a column – slenderness ratio – Euler's critical stress – Limitations of Euler's theory – Rankine – Gordon formula

#### **Thin and Thick Cylinders:**

Thin seamless cylindrical shells – Derivation of formula for longitudinal and circumferential stresses – hoop, longitudinal and volumetric strains – changes in diameter and volume of thin cylinders – Thin spherical shells.

**Thick Cylinders:** Introduction Lamé's theory for thick cylinders – Derivation of Lamé's formulae – distribution of hoop and radial stresses across thickness

#### **Course Outcomes:**

S.No	Course Outcomes	BTL
1	Understand the basic materials behaviour under the influence of different external loading conditions and the support conditions.	L2
2	Understand bending stress & shear stress concepts for determination of stresses developed in the beams due to various loading conditions	L2
3	Understand the basic concepts of Principal stresses developed in a member when it is subjected to stresses along different axes and applications of various theories of failures.	L2
4	Determine stresses in different engineering applications like shafts, springs, subjected to different loading conditions.	L4
5	Assess safe load over columns & struts under different loading conditions, stresses across section of the thin and thick cylinders to arrive at optimum sections to withstand the internal pressure using Lamé's equation	L4

#### **Text Books:**

1. Strength of Materials by R.K Bansal, Lakshmi Publications
2. Strength of Materials by S. Ramamrutham
3. Mechanics of Materials- by R. C. Hibbler

#### **Reference Books:**

1. Strength of Materials by R.K.Rajput, S.Chand & Co, New Delhi
2. Strength of Materials by R. Subramanian, Oxford Publications
3. Mechanics of Materials by B.C Punmia, Jain and Jain.
